In Vitro Embryogenesis in Higher Plants

Series: Methods in Molecular Biology, Vol. 1359

- ▶ Includes cutting-edge methods and protocols
- ▶ Provides step-by-step detail essential for reproducible results
- ▶ Contains key notes and implementation advice from the experts

This volume presents an overview of recent advances, innovative applications, and future prospects of *in vitro* embryogenesis in higher plants. The book's chapters are divided into five parts: Part I contains reviews on general topics (microspore; zygotic and somatic embryogenesis; *in vitro* and *in vivo* asexual embryogenesis; advances on the genetic, physiological, and proteomic knowledge of somatic embryo formation; role of apoptosis and mitochondria in somatic embryogenesis; and innovation in the use of bioreactors). The remaining four parts discuss step-wise protocols on somatic embryogenesis in selected horticultural plants (Part II); forest trees (Part III); gametic embryogenesis (Part IV); and pivotal topics, such as the detection of epigenetics modifications during microspore embryogenesis, the *in vitro* embryogenesis and plant regenerations from isolated zygotes, the synthetic seed production, the induction and maturation of somatic embryos, and the cryostorage of embryogenic cultures (Part V). Written in the highly successful Methods in Molecular Biology series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls.

Authoritative and thorough, *In Vitro Embryogenesis in Higher Plants*, is a useful source of information and ideas for plant tissue culturists, cell biologists, embryologists, horticulturists, and operators of commercial nurseries. This book will introduce the fascinating work in *in vitro* embryogenesis in higher plants to students and young scientists.
